IMPORTANT: Your new tool has been engineered and manufactured to WEN's highest standards for dependability, ease of operation, and operator safety. When properly cared for, this product will supply you years of rugged, trouble-free performance. Pay close attention to the rules for safe operation, warnings, and cautions. If you use your tool properly and for its intended purpose, you will enjoy years of safe, reliable service.

For replacement parts and the most up-to-date instruction manuals, visit ***WENPRODUCTS.COM***

Magnetic Oil Dipstick (Model 55201)

WEN Parallel Connection Kit

Weatherproof Generator Cover (Model 56310iC)

High-Altitude Kit (Part DF400i-HA36 & DF400i-HA68)

SPECIFICATIONS

GENERATOR

Rated Wattage	Gasoline: 3500 Watts; LPG: 3150 Watts
Surge Wattage	Gasoline: 4500 Watts; LPG: 4050 Watts
Rated Voltage	AC: 120V
	DC: 12V (Cigarette Lighter), 5V (USB)
Rated Amperage	AC: 29.2A (Total), 29.2A (TT-30R), 20A (5-20R)
	DC: 10A (Total), 8A (Cigarette Lighter), 1A/2.1A (USB)
Phase	Single
Frequency	60Hz
Decibel Rating	58 dBA (25% load from 22 feet away)
Product Dimensions	Length: 23.2 in. (590 mm)
	Width: 18 in. (456 mm)
	Height: 20.1 in. (511 mm)
Product Net Weight	100.0 lbs (45.5 kg)

ENGINE

Engine Type	4-Stroke, OHV, Single Cylinder with Forced Air Cooling System
Engine Displacement	212cc
Engine Speed	3700 RPM
Fuel Tank Capacity	2.2 US Gallons (8.50 L), 87 Octane Minimum
Oil Capacity	18.6 fl. oz. (0.55 L)
Half-Load Run Time	8.5 hours (gasoline); 9 hours (20 lb LPG tank)
Lubrication System	Splash Lubrication
Spark Plug Type	NGK BPR6ES / Torch F6RTC
Spark Plug Gap	0.7 - 0.8 mm (0.028 - 0.031 in.)
Spark Plug Torque	1/2 - 3/4 turn after gasket contacts base or 15 ft-lbs
Battery	12V, 1.6Ah, Lithium-Ion

INTRODUCTION

Thanks for purchasing the WEN 4500-Watt Dual-Fuel Inverter Generator. Refer to the illustration below for the location of the serial number on the side of the engine. Record the generator information in the spaces provided below. If assistance for information or service is required, please contact customer service by calling **1-847-429-9263**, M-F 8-5 CST; you will be asked to provide the following generator information when calling.

Generator Model Number: DF452iX

Date of Purchase: _____

Purchased From: _____

Serial Number: _____

SERVICE RECORD

Record the service dates of your generator in the chart below. Please perform maintenance checks and operations according to the “Maintenance” section of the manual.

Service Record	Date	Date	Date	Date	Date	Date
Change Oil						
Change Spark Plug						
Clean Fuel Tank						
Clean Air Cleaner						
Clean Spark Arrestor						

TO MAXIMIZE THE LIFESPAN OF YOUR GENERATOR: We recommend running your generator at least once a month for 20 to 30 minutes. Start the generator according to the instructions and plug a small load in to make sure the outlet is producing electricity.

SAFETY INFORMATION

 **WARNING!** Before operating the generator, make sure to read all safety warnings and all instructions. Failure to follow the warnings and instructions may result in electric shock, fire or serious injury.

SAFETY INTRODUCTION

Safety is a combination of common sense, staying alert, and knowing how your tool works. This manual contains important information regarding the generator's potential safety concerns, as well as preparation, operation, and maintenance instructions. Before operating this generator, be sure to read and observe all warnings and instructions both on the generator labels and in this instruction manual. Failure to follow all instructions listed below may result in personal injury.

NOTE: The following safety information is not meant to cover all possible conditions and situations that may occur. WEN reserves the right to change this product and specifications at any time without prior notice.

At WEN, we are continuously improving our products. If you find that your tool does not exactly match this manual, please visit **wenproducts.com** for the most up-to-date manual or contact customer service at **1-847-429-9263**, M-F 8-5 CST.

Keep this manual available to all users during the entire life of the tool and review it frequently to maximize safety for both yourself and others.

SAVE THESE SAFETY INSTRUCTIONS.

SAFETY SYMBOLS

The purpose of following safety symbols is to attract your attention to possible dangers. The safety symbols, and their explanations, deserve your careful attention and understanding. The safety warnings do not by themselves eliminate any danger. The instructions or warnings they give are not substitutes for proper accident prevention measures.

 **DANGER:** indicates a hazard, which, if not avoided, will result in death or serious injury.

 **WARNING:** indicates a hazard, which, if not avoided, could result in death or serious injury.

 **CAUTION:** indicates a hazard, which, if not avoided, might result in minor or moderate injury.

CAUTION! when used without the alert symbol, indicates a situation that could result in damage to the machine.

NOTICE REGARDING EMISSIONS

Engines that are certified to comply with U.S. EPA emission regulations for SORE (Small Off Road Equipment), are certified to operate on regular unleaded gasoline, and may include the following emission control systems: (EM) Engine Modifications and (TWC) Three-Way Catalyst (if so equipped).

QUESTIONS? PROBLEMS?

In order to answer questions and solve problems in the most efficient and speedy manner, contact customer service at **1-847-429-9263**, M-F 8-5 CST or email **techsupport@wenproducts.com**.

GENERATOR SAFETY WARNINGS

DANGER! CARBON MONOXIDE

Using a generator indoors **CAN KILL YOU IN MINUTES**. Generator exhaust contains carbon monoxide (CO). This is a poison gas you cannot see or smell. If you can smell the generator exhaust, you are breathing CO. But even if you cannot smell the exhaust, you could be breathing CO.

NEVER use a generator inside homes, garages, crawl spaces, or other partially enclosed areas. Deadly levels of carbon monoxide can build up in these areas. Using a fan or opening windows and doors does NOT supply enough fresh air. **ONLY** use a generator outside and far away from windows, doors, and vents. These openings can pull in generator exhaust.

Even if you use a generator correctly, CO may leak into the home. **ALWAYS** use a battery-powered or battery-backup CO alarm in the home. If you start to feel sick, dizzy, or weak after the generator has been running, move to fresh air **RIGHT AWAY**. See a doctor. You may have carbon monoxide poisoning.

 **WARNING! RISK OF EXPLOSION. HIGHLY FLAMMABLE:** This generator may emit highly flammable and explosive gasoline vapors, which can cause severe burns or even death, if ignited. A nearby open flame can lead to explosion even if not directly in contact with gasoline.

- Do not operate near open flame, heat, or any other ignition source. Do not smoke near the generator.
- Always operate on a firm, level surface.
- Always turn generator off before refueling. Allow generator to cool for at least 2 minutes before removing fuel cap. Loosen cap slowly to relieve pressure in tank.
- Do not overfill fuel tank. Gasoline may expand during operation. Do not fill to the top of the tank. Allow for expansion. Always check for spilled fuel before operating.
- If fuel spills, move the generator at least 30 feet away from the spill and wipe clean any spilled fuel before starting the engine.
- Empty fuel tank before storing or transporting the generator.

 **WARNING!** If this generator is used as a supply for a building's wiring system, the generator must be installed by a qualified electrician and connected to a transfer switch as a separately derived system in accordance with all applicable laws and electrical codes and the National Electrical Code, NFPA 70. The generator shall be connected to a transfer switch that switches all conductors excluding the equipment grounding conductor. The frame of the generator shall be connected to an approved grounding electrode.

 **CALIFORNIA PROPOSITION 65 WARNING:** This product contains chemicals and produces exhaust known to the State of California to cause cancer, birth defects and other reproductive harm.

GENERATOR SAFETY WARNINGS

⚠ WARNING! Do not let comfort or familiarity with the product replace strict adherence to product safety rules. Failure to follow the safety instructions may result in serious personal injury.

⚠ WARNING

- **INGESTION HAZARD:** This product contains a button cell or coin battery.
- **DEATH** or serious injury can occur if ingested.
- A swallowed button cell or coin battery can cause **Internal Chemical Burns** in as little as **2 hours**.
- **KEEP** new and used batteries **OUT OF REACH** of **CHILDREN**.
- **Seek immediate medical attention** if a battery is suspected to be swallowed or inserted inside any part of the body.

BUTTON OR COIN CELL BATTERY SAFETY INFORMATION

PLEASE READ THE FOLLOWING CAREFULLY:

1. Remove and immediately recycle or dispose of used batteries according to local regulations and keep away from children. Do NOT dispose of batteries in household trash or incinerate.
2. Even used batteries may cause severe injury or death.
3. Call a local poison control center for treatment information.
4. The compatible battery type is CR2016 and the nominal battery voltage is 3V.
5. Non-rechargeable batteries are not to be recharged.
6. Do not force discharge, recharge, disassemble, heat above 158°F, or incinerate. Doing so may result in injury due to venting, leakage or explosion resulting in chemical burns.

FOR REPLACEABLE BUTTON OR COIN CELL BATTERIES, PLEASE READ THE FOLLOWING CAREFULLY:

1. Ensure the batteries are installed correctly according to polarity (+ and -).
2. Do not mix old and new batteries, different brands or types of batteries, such as alkaline, carbon-zinc, or rechargeable batteries.
3. Remove and immediately recycle or dispose of batteries from equipment not used for an extended period of time according to local regulations.

4. Always completely secure the battery compartment. If the battery compartment does not close securely, stop using the product, remove the batteries, and keep them away from children.

OPERATING ENVIRONMENT

1. **Using a generator indoors can kill you in minutes.** Only use a generator outside and far away from windows, doors and vents.
2. **Do not smoke near the generator.**
3. **Do not operate near open flame, heat, or flammable materials.** This generator may emit highly flammable and explosive gasoline vapors, which can cause severe burns or even death if ignited. A nearby open flame can lead to an explosion even if it isn't directly in contact with gasoline.
4. **Do not expose the generator to rainy or wet conditions; doing so significantly increases the risk of electrical shock.** Never handle the generator, electronic devices, or any cord while standing in water, while barefoot, or when hands or feet are wet.
5. **Always operate the generator on a dry, firm, level surface.**
6. **The generator should have at least 5 feet of clearance from buildings or other equipment during operation.**
7. **Do not allow children or non-qualified persons to operate the generator.**

GENERATOR SAFETY WARNINGS

 **WARNING!** Do not let comfort or familiarity with the product replace strict adherence to product safety rules. Failure to follow the safety instructions may result in serious personal injury.

TO MAXIMIZE THE LIFESPAN OF YOUR GENERATOR: We recommend running your generator at least once a month for 20 to 30 minutes. Start the generator according to the instructions and plug a small load in to make sure the outlet is producing electricity. If you do not run it often, it will greatly shorten the generator's lifespan and void the warranty.

GENERATOR PREPARATION

1. **Always ground the generator before using it to maximize safety** (see "Ground the Generator" section).
2. **Do not overfill fuel tank, as gasoline may expand during operation.** Do not fill to the very top of the tank. Leave room for gasoline expansion. Always check for spilled fuel before operating.
3. **If any part of the generator, electrical device or power cord is broken, damaged, or defective, make sure it is repaired or replaced before operation.** Service should only be performed by a qualified technician. Do not use receptacles or cords that show signs of damage, such as broken or cracked insulation.
4. **Use a ground fault circuit interrupter (GFCI) in highly conductive areas such as metal decking or steel work.** Extension cords with in-line GFCIs are recommended for these operations to maximize safety.
5. **If connecting the generator to a building's electrical system for standby power, you MUST consult a qualified electrician and install a transfer switch.** Such connections must comply with local electrical laws and codes. Failure to comply can create a back-feed, which may result in serious injury or death to utility workers.
6. **Never modify the generator in any way.** Modifying or using the machine for any other purpose for which it is not designed may result in serious injuries, machine damage and voiding of the warranty.

GENERATOR OPERATION

1. **Only use the generator for its intended purposes.** Modifying or using the generator for operations for which it was not designed may cause hazards and personal injury.
2. **Do not touch bare wires or receptacles (outlets).**
3. **Do not turn on electrical devices until after they are connected to the generator.**

4. **Do not exceed the wattage capacity of the generator by plugging in more electrical devices than the unit can handle.** This could damage the generator and/or connected electrical devices. Check the operating voltage and frequency requirements of all electrical devices prior to plugging them into the generator.

5. **Allow generator to run for several minutes before connecting electrical devices.** Do not start or stop engine with electrical devices plugged in to the receptacles. Failure to do so could damage the generator and/or connected electrical devices.

6. **Generators vibrate in normal use.** During and after the use of the generator, inspect both the generator as well as extension and power supply cords for damage resulting from vibration.

7. **Do not touch hot parts.** This generator produces heat when running. Temperatures near exhaust can exceed 150°F (65°C). Allow generator to cool down after use before touching engine or areas of the generator that become hot during use.

8. **Turn off all connected electrical devices before stopping the generator.**

9. **Always turn generator off before refueling.** Allow generator to cool for at least 2 minutes before removing fuel cap. Loosen cap slowly to relieve pressure in tank.

10. **Turn the engine switch and fuel selector knob to "OFF" position when the engine is not running.**

11. **Empty fuel tank before storing or transporting the generator.** Do not store generator or gasoline near furnaces, water heaters, or any other appliances that produce heat or have automatic ignitions. Store the generator and fuel away from sparks, open flames, pilot lights, heat and other sources of ignition.

12. **Always wash hands after handling generator.**

UNPACKING & PACKING LIST

UNPACKING

With the help of a friend or trustworthy foe, such as one of your in-laws, carefully remove the generator from the packaging and place it on a sturdy, flat surface. Make sure to take out all contents and accessories. Do not discard the packaging until everything is removed. Check the packing list below to make sure you have all of the parts and accessories. If any part is missing or broken, please contact customer service at **1-847-429-9263** (M-F 8-5 CST), or email techsupport@wenproducts.com.

PACKING LIST

Screwdriver

KNOW YOUR INVERTER GENERATOR

TOOL PURPOSE

Inverter Generators provide you with clean and quiet power, when and where you need it most. Refer to the following diagrams to become familiarized with all the parts and controls of your Generator. The components will be referred to later in the manual for assembly and operation instructions.

GENERATOR

KNOW YOUR INVERTER GENERATOR

CONTROL PANEL

1. Data Meter with Indicator Light

2. Eco-Mode Switch

Turn ON to increase fuel economy and runtime when the load is below 2625W.

3. Parallel Connection Port

Connect two WEN inverter generators through a parallel connection kit for a higher output.

4. Remote Pairing Button

Use this button to pair the remote and generator. See "REMOTE START" section (pages 22 - 23).

5. Engine Start / Stop Button

Use this button to start or stop the generator. The button will also flash different colors to provide important information about your generator. See "Starting Your Generator" (p. 20) and "Shutting Off Your Generator" (p. 33).

6. DC 12V Cigarette-Lighter Style Receptacle

7. LPG Inlet

8. Grounding Nut

Ground generator to reduce risk of electric shock.

9. DC Circuit Breaker (10A)

10. AC 120V NEMA TT-30 RV Receptacle

11. AC Circuit Breaker (20A)

12. AC 120V NEMA 5-20R Receptacles

13. Overload Reset

If the overload light is ON, press this button to reset.

14. Battery Switch

Control whether or not the battery is connected to the control panel. Always turn battery switch OFF to conserve power after shutting down generator. You can also shut down generator by turning the battery switch OFF.

15. 2-in-1 Switch

Turn switch to run or automatically shut off generator.

16. CO WATCHDOG Carbon Monoxide Monitor

Measures the accumulation of poisonous CO gas while the generator is running. If the level of CO gas gets too high, the CO Watchdog system will automatically shut down the generator.

GENERATOR PREPARATION

REMOVING THE MOUNTING PLATES

Your generator is shipped with four mounting plates that secure the engine to the generator housing in order to prevent machine damage during shipping. Make sure to remove the four mounting plates before operating your generator. Failure to do so could lead to engine damage.

To remove the mounting plates:

1. With the help of another person, place generator on an elevated platform such as table or workbench. Make sure the generator is stable. Do not tilt the generator as there may be remaining oil inside the crankcase from testing.
2. Remove the four nuts (Fig. 1 - 3) and mounting plates (Fig. 1 - 2) from the generator's baseplate (Fig. 1 - 1).
3. Follow the instructions in the following pages to prepare your generator for starting.

GENERATOR PREPARATION

The following section describes the necessary steps to prepare the generator for use. If you are unsure about how to perform any of the steps, please call **1-847-429-9263** M-F 8-5 CST for customer service. Failure to perform these steps properly can damage the generator or shorten its life.

STEP 1 - ADD / CHECK OIL

The generator is shipped without oil. User must add the proper amount of oil before operating the generator for the first time. The oil capacity of the engine crankcase is 18.6 fl. oz. (0.55 L).

ENGINE OIL RECOMMENDATIONS

Select good quality detergent oil bearing the American Petroleum Institute (API) service classifications SJ, SL, or SM (synthetic oils may be used). Select the SAE viscosity grade of oil that matches the expected operating temperature.

- **30W Engine Oil**
Temperatures above 40°F
- **10W-30 Engine Oil**
Temperatures between 0°F - 40°F
- **Synthetic 5W-30 Engine Oil**
All temperature ranges

To add oil, follow these steps:

1. Place the generator on a level surface. Make sure the engine is off before adding or checking oil.

CAUTION: Keep the generator level! Tilting the generator to assist in filling will cause oil to flow into the wrong areas of the engine and cause damage.

2. Turn the oil access cover knob to the unlocked position, and remove the access cover from the side panel. Unscrew the oil dipstick from the engine (Fig. 2).

3. Using an oil funnel or appropriate dispenser, slowly add oil into the oil fill, being careful not to overfill the unit. Fill the crankcase to the upper fill line so you can visually see the oil coming halfway up the oil fill threads (Fig. 3).

4. Reinstall the oil dipstick and firmly tighten it. Wipe clean any spilled oil.

5. Reinstall the oil access cover. Turn the oil access cover knob to the locked position to secure the cover in place.

GENERATOR PREPARATION

STEP 1 - ADD / CHECK OIL (CONTINUED)

For subsequent operation, the oil level should be checked before each use, or after every 8 hours of operation. The generator is equipped with a low-oil sensor and will not start without a sufficient amount of oil.

To check oil level (before every subsequent start):

1. Place the generator on a level surface. Make sure the engine is off before adding or checking oil.
2. Open the oil access cover. Remove and wipe the dipstick with a clean rag.
3. Insert the dipstick into the oil fill without screwing it in. Remove the dipstick to check the oil mark (Fig. 4).

If the oil mark covers less than one half of the dipstick, slowly add oil until the oil mark reaches to the top of the dipstick (or when you can see the oil coming halfway up the oil fill threads).

4. Wipe clean any oil leaks and firmly tighten the dipstick. Reinstall the oil access cover.

OIL LEVEL SHUTDOWN

To protect the unit from damage, the generator is equipped with a low-oil-pressure shutoff that will automatically stop the engine when the oil level is too low. The yellow low oil indication light (Fig. 5) will turn ON to remind you that the engine oil level is low and need to be refilled.

The oil level of the engine should be checked before each start to ensure that the engine crankcase contains sufficient lubricant.

TIP: Your WEN generator is compatible with the WEN 55201 Magnetic Oil Dipstick (not included), available for purchase at wenproducts.com. The dipstick's industrial-strength magnetic tip will collect metal shavings from your generator's oil compartment to help preserve the engine and extend your generator's lifespan.

Fig. 4

Fig. 5

GENERATOR PREPARATION

STEP 2 - ADD / CHECK FUEL

FUEL OPTION A: GASOLINE

⚠ WARNING! RISK OF EXPLOSION. HIGHLY FLAMMABLE: This generator may emit highly flammable and explosive gasoline vapors, which can cause severe burns or even death, if ignited. A nearby open flame can lead to explosion even if not directly in contact with gasoline.

- Do not operate near open flame, heat, or any other ignition source. Do not smoke near the generator.
- Always operate on a firm, level surface.
- Always turn generator off before refueling. Allow generator to cool for at least 2 minutes before removing fuel cap. Loosen cap slowly to relieve pressure in tank.
- Do not overfill fuel tank. Gasoline may expand during operation. Do not fill to the top of the tank. Allow for expansion. Always check for spilled fuel before operating.
- If fuel spills, move the generator at least 30 feet away from the spill and wipe clean any spilled fuel before starting the engine.
- Empty fuel tank before storing or transporting the generator.

Use **ONLY** fresh (within 30 days from purchase), lead-free gasoline with a minimum of 87 octane rating. The generator performs best with ethanol-free gasoline. **DO NOT** use gasoline with over 10% ethanol. The capacity of the fuel tank is 2.2 US gallons (8.50 L). Do not mix oil with gasoline.

To add gasoline:

1. Make sure the generator is shut OFF and on a level surface. Unscrew the fuel cap (Fig. 6) and set it aside. The fuel cap may be tight and hard to unscrew.
2. Slowly add unleaded gasoline to the fuel tank. Be careful not to overfill.

NOTE: Do not fill the fuel tank to the very top. If you do so, gasoline will expand and spill during use, even with the fuel cap in place.

3. Reinstall fuel cap and wipe clean any spilled gasoline with a dry cloth.

To check fuel level:

During operation, the fuel level will be displayed by the indicator lights on the right side of the multi-meter. If the fuel level is low, refill the fuel tank before starting your generator for the next time.

IMPORTANT:

- Avoid getting dirt or water into the fuel tank.
- Keep gasoline away from sparks, open flames, pilot lights, heat, and other sources of ignition.
- Gasoline can age in the tank and make starting difficult. Never store the generator for more than 2 months with fuel in the tank.
- Never use an oil/gasoline mixture.
- Never use old gasoline.

GENERATOR PREPARATION

STEP 2 - ADD / CHECK FUEL (CONTINUED)

FUEL OPTION B: LIQUID PETROLEUM GAS (LPG)

To connect your generator to an LPG cylinder:

1. Take off the safety caps from the cylinder valve, generator mounted regulator, and regulator connecting hose ends.

2. With the LPG tank valve closed, attach the LPG regulator connecting hose to the valve. Turn the plastic coupling from the hose right (clockwise) to tighten hose assembly onto the LPG tank (Fig. 7).

3. Remove the protective rubber cover from the LPG inlet (Fig. 8 - 1) on the generator panel. Connect the nut on the other end of the regulator connecting hose to the LPG inlet. Tighten the nut using the included 19mm wrench. Turn the 2-in-1 dial switch to OFF.

4. Turn the LPG tank valve ON (Fig. 9) and check for leaks by spraying soapy water to check connections. If bubbles appear, become larger in size, or increase in number, a leak exists. This **MUST** be corrected before using generator. Contact WEN customer service at **1-847-429-9263**, M-F 8-5 CST, or email **techsupport@wenproducts.com** for assistance.

NOTE: You can use Teflon (or other tape) to secure the connection of the LPG hose to your generator.

NOTE: If you would like to purchase other accessories for your dual-fuel generator, consult your local dealer of propane and propane accessories, I tell you what.

⚠ CAUTION! Always position the LPG cylinder so the connection between the tank and LPG inlet won't cause sharp bends or kinks in the hose.

⚠ WARNING! Risk of burns. Contact with liquid contents of cylinder will cause freeze burns to the skin. If liquid contents contacts skin or eyes, seek immediate medical attention.

⚠ WARNING! When transporting and storing, keep cylinder secured in an upright position with cylinder valve turned off. Keep cylinders ventilated and away from heat when in a vehicle.

GENERATOR PREPARATION

AUTO FUEL SELECTION

Your generator is equipped with Auto Fuel Selection Technology. What this means is that the generator will automatically select the fuel source (LPG or gasoline) depending on availability. LPG is prioritized; this means that if a propane tank with enough LPG is connected, the generator will automatically use LPG. If no propane tank is connected, or if there is no LPG remaining in the tank, the generator will use gasoline (if there is gasoline in the fuel tank). Refer to Table 1 below for information on how to set up your generator for a particular fuel.

	Propane tank valve	2-in-1 dial on generator
I want to use gasoline.	Closed	Run
I want to use LPG.	Open	Run* or Off

Table 1 – Auto Fuel Selection® chart. *It is ideal to run the generator on LPG with the fuel valve closed (OFF), but if it stays open (RUN), the generator will still run properly.

NOTE: Make sure the generator can handle the load(s) you plan to connect. The generator can provide more power when running on gasoline than on LPG. Consult the specifications table on p. 3, as well as page 26 ("Calculating the Wattage of Your Device(s)") to ensure that your load(s) will not exceed the rated wattage for a particular fuel. See also "Switching Fuels" (p. 29) for more information.

STEP 3 - CONNECT THE BATTERY

 **WARNING!** Use only genuine WEN batteries with your generator (part no. **56380i-1304**). Use of other batteries may induce premature product failure and could pose a safety risk.

ABOUT THE BATTERY

1. The lithium-ion battery supplied with your generator is only partially charged, in order to maximize its service life. The battery may not have enough charge to start the engine during its first use. If this is the case, connect the battery according to the instructions below, and start the generator using the recoil starter, according to the instructions below. The battery will receive charge when the generator is running.
2. Lithium-ion batteries are subject to a natural aging process. The battery must be replaced at the latest when its capacity falls to just 80% of its capacity when new. Weakened cells in an aged battery are no longer capable of meeting the high power requirements needed for the proper operation of your generator, and therefore pose a safety risk.
3. **DO NOT INCINERATE BATTERY.** Do not throw the battery into an open fire as this poses a risk of explosion. Do not ignite the battery or expose it to fire.
4. **AVOID DAMAGE AND SHOCKS.** Immediately replace batteries that have been dropped from a height of more than one meter (3 feet) or those that have been exposed to violent shocks, even if the housing of the battery appears to be undamaged. The battery cells inside the battery may have suffered serious damage. In such instances, please read the waste disposal information on p. 38 for proper battery disposal.
5. **DO NOT CRUSH, DROP OR DAMAGE BATTERY.** Do not use the battery if it has sustained a sharp blow, been dropped, run over or has been damaged in any way (e.g. pierced with a nail, hit with a hammer, stepped on, etc.).
6. **DO NOT DISASSEMBLE.** Incorrect reassembly may pose a serious risk of electric shock, fire or exposure to toxic battery chemicals. If battery or charger are damaged, call WEN customer service at **1-847-429-9263** for assistance.
7. **DO NOT SHORT CIRCUIT.** Batteries will short circuit if a metal object makes a connection between the positive and negative contacts on the battery. Do not place the battery near anything that may cause a short circuit, such as paper clips, coins, keys, screws, nails and other metallic objects. A short-circuited battery poses a risk of fire and severe personal injury. **NOTE:** The safe temperature range for charging the battery is 25°F – 104°F.

The generator is shipped with the lithium-ion battery's quick-connectors disconnected to maximize safety. To start the generator using electric start, the battery must be connected.

GENERATOR PREPARATION

STEP 3 - CONNECT THE BATTERY (CONTINUED)

⚠ WARNING! Use only genuine WEN batteries with your generator (part no. **56380i-1304**). Use of other batteries may induce premature product failure and could pose a safety risk.

To connect the battery:

1. Using a coin or flat-head screwdriver (not included), turn the screw (Fig. 10 - 1) on the battery access cover (Fig. 10 - 2) and remove the cover.
2. Pull downwards on the rubber belt (Fig. 11 - 1). With your other hand, free the metal buckle from the hook beneath the battery.
3. Connect the two ends of the quick connector on the battery (Fig. 12) to connect the battery to the generator's system.
4. Slide the battery back into the generator. Pull downwards on the rubber belt (Fig. 13 - 1). With your other hand, latch the metal buckle onto the hook beneath the battery.
5. Reinstall the battery access cover (Fig. 14 - 1) using a coin or flat-head screwdriver (not included) to turn the screw (Fig. 14 - 2).

IMPORTANT: If you do not plan to use the generator for a long period of time, we recommend **DISCONNECTING** the quick-connectors to protect the battery from losing charge. After disconnecting the quick-connectors, cover the free end with an insulator such as electrical tape. You may also choose to use a trickle charger (not included) to maintain battery charge.

GENERATOR PREPARATION

STEP 4 - GROUND THE GENERATOR

To reduce the risk of electric shock and to maximize safety, the generator should be properly grounded.

Ground the generator by tightening the grounding nut (Fig. 15 - 1) on the front control panel against a grounding wire. A generally acceptable grounding wire is a No. 12 AWG (American Wire Gauge) stranded copper wire.

This grounding wire should be connected at the other end to a copper, brass, or steel grounding rod that is driven into the earth. Wire and grounding rods are not included with the generator.

NOTE: Grounding codes can vary by location. Contact a local electrician to check the area codes.

⚠ WARNING! Failure to properly ground the generator increases your risk of electric shock.

HIGH ALTITUDE OPERATION ABOVE 3000 FEET

The fuel system on this generator may be affected by operation at high altitudes. Proper operation can be ensured by installing an altitude kit at altitudes higher than 3000 feet above sea level. At elevations above 8000 feet, the engine may experience a decrease in performance, even with the proper altitude kit. Operating this generator without said kit may increase the engine's emissions and decrease both fuel economy and performance.

You can order the kit at wenproducts.com by searching part DF400i-HA. There are two kits - one for altitudes between 3000 and 6000 feet (**part no. DF400i-HA36**), and the other for altitudes from 6000 to 8000 feet (**part no. DF400i-HA68**). This kit should be installed by a qualified mechanic. Refer to the instructions included with your altitude kit for more information about installation.

NOTE: The high altitude kit must be installed for operation above 3000 feet, regardless of the fuel source (LPG or gasoline) used.

⚠ WARNING! To prevent serious injury from fire, follow the kit installation procedures in a well-ventilated area away from ignition sources. If the engine is hot from use, shut the engine off and wait for it to cool before proceeding. Do not smoke near the generator. Warranty will be void if adjustments are not made for high altitude use.

CAUTION: Engines with the high-altitude kit installed operated at lower altitudes could cause severe engine damage and affect emissions compliance. Be sure to uninstall the high altitude kit when operating at altitudes below 3000 feet.

After completing the above preparation, the generator is ready to be started.

STARTING YOUR GENERATOR

Before starting the generator, make sure you have read and performed the steps in the “Generator Preparation” section of this manual. If you are unsure about how to perform any of the steps in this manual please call **1-847-429-9263** M-F 8-5 CST for customer service.

DANGER! CARBON MONOXIDE

Using a generator indoors **CAN KILL YOU IN MINUTES**. Generator exhaust contains carbon monoxide (CO). This is a poison gas you cannot see or smell. If you can smell the generator exhaust, you are breathing CO. But even if you cannot smell the exhaust, you could be breathing CO.

NEVER use a generator inside homes, garages, crawl spaces, or other partially enclosed areas. Deadly levels of carbon monoxide can build up in these areas. Using a fan or opening windows and doors does NOT supply enough fresh air. **ONLY** use a generator outside and far away from windows, doors, and vents. These openings can pull in generator exhaust.

Even if you use a generator correctly, CO may leak into the home. **ALWAYS** use a battery-powered or battery-backup CO alarm in the home. If you start to feel sick, dizzy, or weak after the generator has been running, move to fresh air **RIGHT AWAY**. See a doctor. You may have carbon monoxide poisoning.

 **WARNING!** The exhaust from this product contains chemicals known to the State of California to cause cancer, birth defects, or other reproductive harm.

 **WARNING!** Do not operate generator near open flame or flammable materials. This generator may emit highly flammable and explosive gasoline vapors, which can cause severe burns or even death if ignited. A nearby open flame can lead to explosion even if it isn't directly in contact with gasoline. Do not smoke near the generator.

 **WARNING!** This generator produces powerful voltage, which can result in electrocution.

 **WARNING!** Do not use in rainy or wet conditions. Do not touch bare wires or receptacles (outlets). Do not allow children or non-qualified persons to operate.

 **WARNING!** Generator should only be connected to electrical devices, either directly or with an extension cord. **NEVER** connect to a building electrical system without a qualified electrician and connected to a transfer switch as a separately derived system. Such connections must comply with local electrical laws and codes. Failure to comply can create a back-feed, which may result in serious injury or death to utility workers.

To maximize safety, **ALWAYS** ground the generator before using it. See section “Ground the Generator”.

Use a ground fault circuit interrupter (GFCI) in highly conductive areas such as metal decking or steel work. GFCIs are available in-line with some extension cords.

CAUTION! Disconnect all electrical loads from the generator before attempting to start.

Follow the instructions on the next page to start your generator.

STARTING YOUR GENERATOR

BEFORE STARTING THE GENERATOR

1. Verify that the generator is outside on a dry, level surface with at least two feet of clearance on all sides.
2. To maximize safety, check that the generator is properly grounded (see "Ground the Generator").
3. Check that there is a sufficient level of oil in the crankcase. Add oil if necessary (see "Add/check Oil").
4. If using gasoline, make sure there is enough gasoline in the fuel tank. Add fuel if necessary (see "Add/check Fuel"). If using LPG, make sure there is enough propane in the tank, and that the tank and regulator hose are connected.
5. Make sure all electrical devices are unplugged from the generator during ignition. Otherwise it will be difficult for the engine to start.

STARTING THE GENERATOR (GASOLINE)

1. Turn the ECO-MODE switch (Fig. 16) to "OFF" during starting.
2. Turn the BATTERY switch (Fig. 16) to "ON".

NOTE: The battery switch must be turned ON when starting the generator, regardless of the method or fuel source used.

3. Turn the 2-in-1 (Fig. 17) switch to the "RUN" position.

Option A: Electric Start

3. Press the engine start / stop button (Fig. A) for one second.

NOTE: The engine start / stop button will begin flashing green, and will automatically adjust the choke and start the engine.

NOTE: The generator will make 6 attempts to start the engine. If after 6 attempts the engine has not started, the engine start / stop button will flash red for 30 seconds. Check the troubleshooting steps. If after checking all these steps the engine still will not start, contact WEN customer service for assistance.

Option B: Pull Start

3. Pull the recoil starter handle slowly until a slight resistance is felt, then pull quickly to start the engine. Return cord gently into the recoil starter. Never allow the cord to snap back (Fig. 18).

NOTE: If the engine does not start after multiple attempts, please consult the troubleshooting guide before attempting to start the generator again. If problems persist, please contact WEN customer service.

NOTE: If you have repeated failed attempts to start the engine, please consult the troubleshooting guide. If problems persist, please call please call **1-847-429-9263** M-F 8-5 CST.

6. Allow the generator to run for several minutes before attempting to connect any electrical devices. This allows the generator to stabilize its speed and temperature.

STARTING YOUR GENERATOR

USING THE REMOTE-START FUNCTION

Your generator comes with a remote-start function, enabling you to (what else?) start your generator remotely. Your generator and the included remote have been paired at the factory, and you can use the remote immediately.

NOTE: In order for the remote start function to work properly, you must be within 98.43 ft (30 m) of the generator. The remote's effective range may vary depending on the battery's state of charge, as well as miscellaneous environmental factors, radio interference, etc.

STARTING THE GENERATOR (REMOTE START)

1. Ensure that the battery switch on the panel is turned ON. Ensure that the battery is connected and is not dead. Ensure that there is enough fuel, and the fuel selector switch is turned to the proper fuel source.

2. Ensure that all electrical devices are disconnected from the generator. Ensure that ECO-MODE is OFF.

3. Press the ON button on the remote control once. DO NOT hold the button down. The generator will wait for a moment, then automatically adjust the choke and start.

NOTE: The generator will make 6 attempts to start the engine automatically. If after 6 attempts the engine has not started, the engine start/stop button will flash red for 30 seconds. Check the troubleshooting steps. If after checking all these steps the engine still will not start, contact WEN customer service for assistance.

4. Connect electrical devices.

NOTE: After the CO Watchdog system shuts down the generator, the generator cannot be restarted using remote start, for safety reasons. You must manually restart the generator using the recoil or electric starter. After doing this, the remote start can be used normally.

STOPPING THE GENERATOR (REMOTE START)

1. Turn off all electrical devices prior to unplugging them from the generator. Unplugging running devices can cause damage to the generator. Never start or stop the generator with electrical devices plugged in or turned on.

2. Let engine run at no-load for several minutes to stabilize its internal temperature. Ensure that ECO-mode is OFF.

3. Press the OFF button on the remote control once. Do NOT hold the button down. The generator will then shut down. The engine start/stop button will flash red and green simultaneously a few times to indicate that the generator was shut down remotely.

4. Once the engine shuts down, if the battery switch is still set to ON, the generator will enter standby mode. In standby mode, the generator can be started using the remote. The engine start/stop button will blink green once every 2 seconds to remind you that the generator is in standby mode.

NOTE: There is no limit to how long the generator will stay in standby mode, so if you forget to turn off the battery switch, it is possible that the battery will be drained the next time you try to use the generator. If you see the engine start/stop switch flashing green, always make sure the battery switch is turned OFF.

NOTE: During remote start and remote start, you may see the data meter display flicker slightly. This is normal and does not indicate a problem.

NOTE: If you purchase a new remote, you will need to pair the new remote with the generator. Follow instructions below. When replacing batteries in a remote, you should not need to pair the generator and remote again, but if you find that it does not work with new batteries, follow the instructions below to pair the generator and remote again.

STARTING YOUR GENERATOR

PAIRING THE REMOTE AND GENERATOR

1. Make sure the battery is connected and charged, and the battery switch on the panel is set to ON.
2. Press the remote pairing button (Fig. B - 1) on the control panel once.
3. The engine start/stop button will flash red once.
4. Press the ON and OFF buttons on the remote simultaneously, within 5 seconds after seeing the engine start/stop button flash.
5. The engine start/stop button will flash red 4 times.
6. The generator will enter standby mode, and the engine start/stop button will flash green every 2 seconds.

NOTE: If in step 4, the ON and OFF buttons are not pressed within 5 seconds, the generator will enter its standby state. Start again from step 2 to pair the remote and generator.

UNPAIRING THE REMOTE AND GENERATOR

1. Make sure the battery is connected and charged, and the battery switch on the panel is set to ON.
2. Press the remote pairing button on the control panel 5 times quickly (within 5 seconds).
3. The engine start/stop button will flash red 4 times, and will clear all stored remote control data.
4. The generator will enter standby mode, and the engine start/stop button will flash green every 2 seconds.

REPLACING REMOTE BATTERIES

Your generator's remote comes with two CR2016 batteries pre-installed and ready to use. However, the batteries will eventually die and need to be replaced.

1. Use a fine-tipped Phillips-head screwdriver to remove the 3 screws on the back of the remote. Do not drop or lose the screws. Open the back of the remote and remove the CR2016 batteries from the battery compartment.
2. Install the new CR2016 batteries in the same orientation as you removed the old batteries. (The + side, which should say "CR2016", faces the back of the remote.)
3. Replace the back of the remote and tighten the screws. Follow the instructions above to pair your remote with the generator (if necessary).

Fig. B

STARTING YOUR GENERATOR

STANDBY MODE

Once the generator is shut down, the generator's remote control function will stay in standby mode while the battery switch is ON. In standby mode, the generator can be started using the remote. The engine start/stop button will blink green once every 2 seconds to remind you that the generator is in standby mode.

NOTE: There is no limit to how long the generator will stay in standby mode, so if you forget to turn off the battery switch, it is possible that the battery will be drained the next time you try to use the generator. If you see the engine start/stop switch flashing green, always make sure the battery switch is turned OFF.

PAIRING MULTIPLE REMOTES

You can pair up to 15 remotes at a time with your generator. Remotes can be purchased from **wenproducts.com**. To pair a new remote with your generator, follow instructions above in "Pairing the Remote and the Generator". You can also pair one remote with as many generators as you like.

NOTE: If you have multiple remotes paired with your generator and you unpair one remote, you will also unpair the other remotes simultaneously. You will need to pair the other remotes with the generator again before they can be used. If at any point you have questions, problems, or concerns about the remote start function, consult the Troubleshooting guide or contact customer service at **1-847-429-9263**.

STARTING THE GENERATOR (LPG)

1. Turn the ECO-MODE switch (Fig. 19) to "OFF" during starting.
2. Turn the Battery switch (Fig. 19) to "ON".

NOTE: The battery switch must be turned ON when starting the generator, regardless of the method or fuel source used.

3. Ensure that all electrical devices are disconnected from the generator.
4. Make sure the propane regulator and hose are securely attached to the propane cylinder and the propane inlet on the generator, and that the propane cylinder valve is turned ON.
5. Prime the engine by pulling the recoil starter 1 - 3 times.
6. Turn the 2-in-1 switch to OFF (Fig. 20).

STARTING YOUR GENERATOR

Option A: Electric Start

7. Press the engine start / stop button (Fig. C) for one second.

NOTE: The engine start/stop button will begin flashing green, and will automatically adjust the choke and start the engine.

NOTE: The generator will make 6 attempts to start the engine. If after 6 attempts the engine has not started, the engine start/stop button will flash red for 30 seconds. Check the troubleshooting steps. If after checking all these steps the engine still will not start, contact WEN customer service for assistance.

Option B: Pull Start

7. Pull the recoil starter handle slowly until a slight resistance is felt, then pull quickly to start the engine. Return cord gently into the recoil starter. Never allow the cord to snap back (Fig. 21).

NOTE: If the engine does not start after multiple attempts, please consult the troubleshooting guide before attempting to start the generator again. If problems persist, please contact WEN customer service.

Fig. C

Fig. 21

NOTE: If you have repeated failed attempts to start the engine, please consult the troubleshooting guide. If problems persist, please call **1-847-429-9263** M-F 8-5 CST.

7. After the engine has started, the output indicator light (green) will light up.

8. Allow the generator to run for several minutes before attempting to connect any electrical devices. This allows the generator to stabilize its speed and temperature.

ENGINE BREAK-IN PROCEDURE

The procedure below should be followed when you receive your generator in order to prolong the engine's service life. This procedure helps to seat the piston rings properly in the cylinder, and will reduce overall wear on the engine.

For the first 8 hours of operation, vary the load, but keep it at or below 50% of the generator's rated wattage, if possible. If your generator is equipped with an Eco-mode switch (only applicable for certain inverter generators), engage Eco-mode periodically during the first 8 hours. After the first 8 hours, change the oil, then change it again after the first 25 hours. You may run the generator at full load after the 8-hour oil change. Refer to the Recommended Maintenance Schedule in Table 5 for the full maintenance schedule.

USING YOUR GENERATOR

CALCULATING THE WATTAGE OF YOUR DEVICE(S)

Connect electrical devices running on AC current according to their wattage requirements. Calculate the total running wattage and starting wattage of the device(s) you wish to connect, and **MAKE SURE** that they are within the capacity of your generator and the capacity of each individual outlet.

Generator Wattage Capacity	GENERATOR RUNNING (RATED) WATTS	GENERATOR STARTING (SURGE) WATTS
	Gasoline: 3500W	Gasoline: 4500W
	LPG: 3150W	LPG: 4050W
	What this means: The generator can produce a maximum of 3500W / 3150W on a continuous basis to supply ongoing power to your electronic devices. NOTE: Also check the rated amperage for each outlet and make sure not to overload the individual outlets.	What this means: Some devices such as box fans require short bursts of extra power in addition to the rated wattage listed by the device to start their motors. The generator can produce a maximum wattage of 4500W / 4050W for a short period of time (seconds) to cover the extra starting power required by your electronic devices.
Electronic Device Wattage Calculation	Find the wattage information of each device you plan to connect. The information should be listed on the device or in its instruction manual, or you may refer to page 25, Table 2. The wattage can be calculated using this equation: Watts = Volts x Amperes	
	To calculate the total running watts of your devices: + Add up the running wattages of all the device(s) you plan to connect. = The total running (rated) wattage. This wattage should NOT exceed the running wattage of 3500W / 3150W. It is recommended to maintain a load at or below 3150W / 2835W (90% of the rated output) to ensure steady voltage output and to prolong the generator's lifespan.	To calculate the total starting watts of your devices: + Add up the total running wattage of all the device(s) you plan to connect. + Add the single highest ADDITIONAL starting wattage out of the device(s) you plan to connect. = The total starting (surge) wattage. This wattage should NOT exceed the starting wattage of 4500W / 4050W.
	If any of either of the total calculated running watts or starting watts is higher than the capacity of your generator, adjust the load until both wattage requirements are met. Otherwise you will overload the generator, and cause damage to the engine and your electrical device(s).	

Table 1 - How to Calculate Wattages

USING YOUR GENERATOR

CALCULATING THE WATTAGE OF YOUR DEVICE(S) - CONTINUED

The chart below serves as a reference for the estimated wattage requirements of common electrical devices. However, do not solely rely on this chart - all electronics and appliances are built differently. Always check the wattage listed on the electrical device before consulting this chart.

Tool or Appliance	Rated (Running) Watts	Surge (Starting) Watts
Electric Water Heater (40 Gal)	4000	0
Hot Plate	2500	0
Saw - Radial Arm	2000	2000
Electric Stove (Each Element)	1500-2800	0
Saw - Circular	1500	1500
Air Compressor (1 HP)	1500	3000
Window Air Conditioner	1200	1800
Saw - Miter	1200	1200
Microwave	1000	0
Well Water Pump	1000	1000
Sump Pump	800	1200
Refrigerator Freezer	800	1200
Furnace Blower	800	1300
Computer	800	0
Electric Drill	600	900
Television	500	0
Deep Freezer	500	500
Garage Door Opener	480	0
Stereo	400	0
Box Fan	300	600
Clock Radio	300	0
Security System	180	0
Dvd Player / VCR	100	0
Common Light Bulb	75	0

Table 2 - Estimated Wattages of Common Electrical Appliances

NOTE: Become familiar with the functions and capacity of each component on the control panel before connecting electrical devices. See page 23 for more information about the components of the control panel. Do not overload generator or individual panel receptacles. Do not connect 50Hz or 3-phase loads to the generator.

USING YOUR GENERATOR

CONNECTING ELECTRICAL DEVICES

When the rated wattage requirement of each electrical device has been determined, add these numbers to find the total rated wattage needed. If this number exceeds the rated wattage (3500 / 3150W) of the generator, DO NOT connect all these devices. Select a combination of electrical devices with a total rated wattage lower than or equal to the rated wattage of the generator.

⚠ CAUTION! Become familiar with the markings on the control panel before connecting electrical devices. Do not connect 3-phase or 50Hz loads to the generator.

1. Before connecting electrical devices, allow the generator to run for a few minutes to stabilize the speed and voltage output.
2. Make sure that all devices are turned off. Start plugging in each electric device, from the highest wattage to the lowest. Check the power indicator light (green) to ensure the generator is producing power.
3. Do not overload the generator or individual panel receptacles. If an overload occurs, the overload indication light (red) will activate. If it is flashing, turn off and unplug one load. If it is solid (not flashing), the generator will cut off power to protect itself. Unplug all electrical devices and then press the reset button to reset the entire circuit, or press the circuit breaker to reset the DC circuit. Check the total wattage of the devices and reduce the load if it exceeds the capacity of the generator. Then, plug the loads back in one by one.

NOTE: If the reset button or circuit breaker does not reset, wait several minutes and try again. If problem still persists, please call **1-847-429-9263** M-F 8-5 CST, or email techsupport@wenproducts.com.

USING YOUR GENERATOR

SOME NOTES ABOUT POWER CORDS

Long or thin cords can drain the power provided to an electrical device by the generator. When using such cords, allow for a slightly higher rated wattage requirement by the electrical device.

Device Requirements			Max. Cord Length (ft) by Wire Gauge				
Amps	Watts (120V)	Watts (240V)	#8 wire	#10 wire	#12 wire	#14 wire	#16 wire
2.5	300	600	NR	NR	NR	375	250
5	600	1200	NR	NR	300	200	125
7.5	900	1800	NR	350	200	125	100
10	1200	2400	NR	250	150	100	50
15	1800	3600	NR	150	100	65	NR
20	2400	4800	175	125	75	50	NR
25	3000	6000	150	100	60	NR	NR
30	3600	7200	125	65	NR	NR	NR
40	4800	9600	90	NR	NR	NR	NR

*NR = Not Recommended

Table 3 - Power Cord Requirement Guide

⚠ WARNING! Generator should **only** be connected to electrical devices, either directly or with an extension cord. NEVER CONNECT TO A BUILDING ELECTRICAL SYSTEM without a qualified electrician and connected to a transfer switch as a separately derived system. Such connections must comply with local electrical laws and codes. Failure to comply can create a back-feed, which may result in serious injury or death to utility workers.

NOTE: For power outages, permanently installed, stationary generators are better suited for providing backup power to your home. Even a properly connected portable generator can become overloaded. This may result in overheating or stressing the machine's components, possibly leading to generator failure.

SWITCHING FUELS

Your generator is equipped with Auto Fuel Selection technology. To maximize your generator's lifespan, we recommend removing all loads from the generator before switching between gasoline and LPG. If this is not possible, reduce loads as much as possible in order to ensure a smooth switch. Your generator is rated to handle a higher load when running on gasoline than on LPG, so keep this in mind when planning your fuel usage.

USING YOUR GENERATOR

ECO-MODE SWITCH

This generator is equipped with an Eco-Mode Idle Control Switch (Fig. 22). Engaging this switch allows the system to regulate the engine speed and automatically adjust its fuel consumption to match the required load. When the electrical load changes, the generator engine will automatically speed up and slow down as needed. This reduces fuel consumption and noise levels, while extending runtime and engine's lifespan.

Keep this switch engaged **ONLY** when the power load requirement is less than 2625W. Do not engage the Eco-Mode Switch when the total load is more than 2625W. The generator engine must run at full speed to supply power for anything over 2625W.

PARALLEL OPERATION

The parallel connection ports (Fig. 23) allow you to connect two WEN generators to increase the total available electrical power. The WEN Parallel Connection Kit can be purchased from **wenproducts.com**. Follow the instructions included with your parallel connection kit for proper installation and operation.

IN CASE OF OVERLOAD

If your generator becomes overloaded from too much drawn wattage, the overload indicator (red) on the control panel will light up. Follow the instructions below when an overload occurs:

- When you're close to overloading the generator, the overload light will start to flash. Reduce the load by turning off and disconnecting your electronic device(s) until the overload light turns off. Then you may continue to operate your generator.
- When you've overloaded the generator, the overload light will stay on and the reset button (Fig. 24) will activate to cut off the output in 3 to 16 seconds, depending on the load. Reduce the load by turning off and disconnecting your electrical device(s) until the overload light turns off. Wait about five minutes and then press the activated reset button to reset the circuit. If no power is produced after resetting, turn off and disconnect all electrical devices and restart your generator.

LIGHT		MEANING	RESOLUTION
GREEN (POWER INDICATOR)	RED (OVERLOAD)		
ON	OFF	Generator output is normal.	No action needed.
ON	Flashing Continuously	Generator is exceeding rated output.	Reduce load on generator.
OFF	Flashes 1x Repeating every 3 seconds	Voltage at alternator is too low. No electrical output.	Check for loose connections. Call 1-847-429-9263 for assistance.
OFF	Flashes 2x Repeating every 3 seconds	Engine speed is too low. No electrical output.	Check carburetor and stepper motor. Ensure Eco-Mode is OFF. Have generator serviced; call 1-847-429-9263 for assistance.
OFF	Flashes 3x Repeating every 3 seconds	Inverter temperature is too high. No electrical output.	Turn generator off and let cool down fully (1-2 hours) before restarting.
OFF	Flashes 5x Repeating every 3 seconds	Voltage at alternator is too high. No electrical output.	Have generator serviced; call 1-847-429-9263 for assistance.
OFF	Flashes 6x Repeating every 3 seconds	Generator has exceeded rated output and cut off power to protect itself. No electrical output.	Turn OFF and disconnect loads. Press RESET button on panel. Reduce load on generator.

USING YOUR GENERATOR

CIRCUIT BREAKERS

In addition to the reset button that protects the generator's main circuit, the circuit breakers (Fig. 25) protect the individual AC and DC circuits. The 20-amp AC circuit breaker will activate when the NEMA 5-20 outlets exceed 20A. The 10-amp DC circuit breaker will activate when the DC 12V and USB outlets exceed 10A. When the circuit breaker activates, turn off and disconnect the device from its respective outlet, and press the circuit breaker to reset.

MULTI-METER

The multi-meter on your generator switches between voltage (e.g. 120.1), frequency (e.g. 60.0Hz), and runtime (e.g. 12.3) every 5 seconds. When you first use the generator, the meter will count runtime, but will not store runtime until the generator is run for longer than 2 hours at a time. Once the generator has been run for more than 2 hours at a time, the meter will track runtime normally. For an example, as well as more explanation, please refer to Table 4 below.

SESSION NUMBER	SESSION LENGTH	HOURLY METER AT END OF SESSION	DOES THE METER RESET?	COMMENTS
1	1 hr 30 min	1.5	Yes, to 0.0	Meter will show "1.5" just before it is shut off, but it has not been run for 2 hours at a time yet.
2	30 min	0.5	Yes, to 0.0	Meter will show "0.5" just before it is shut off, but it has not been run for 2 hours at a time yet.
3	1 hr	1	Yes, to 0.0	Meter will show "1.0" just before it is shut off, but it has not been run for 2 hours at a time yet.
4	3 hr	3	No	Meter will show "3.0" at the end, since it has been run for more than 2 hours. It will not include the 3 hours (1.5 + 0.5 + 1) the generator was run before.
5	2 hr	5	No	Meter will show "5.0" at the end, since it has been run for 3 + 2 = 5 hours. The meter is counting normally, and will continue operating normally.

Table 4 - Meter Display

Every 50 hours, the meter will display "--[", which is to remind you to perform 50-hour maintenance. Consult the maintenance chart for recommended procedures. The display code will appear every 15 seconds for 6 minutes. After 6 minutes, or after the generator is shut down and restarted, the code will clear and display voltage, frequency, and runtime, as before.

NOTE: The fuel gauge on your multi-meter displays the amount of gasoline in the tank. It does not display the amount of LPG remaining.

USING YOUR GENERATOR

CO SENSOR INFORMATION

The CO Watchdog carbon monoxide monitoring system (Fig. 26 - 1) measures the accumulation of poisonous CO gas while the generator is running. If the level of CO gas gets too high, the CO Watchdog system will automatically shut down the generator. **This system is not a substitute for an indoor CO alarm.**

Whenever the CO Watchdog system shuts down the generator, the LED on the generator control panel (Fig. 26 - 1) will **blink red** for at least 5 minutes after the generator is shut down. **If you notice that the LED is blinking red, vacate the area immediately.** Go to an open, outdoor area. Ventilate the area around the generator thoroughly before returning. Let the generator stay shut down for a few minutes before restarting the engine. This should allow carbon monoxide to dissipate from the area. If you restart the generator and the CO Watchdog detects that CO levels are still too high, it will shut down the generator again. If CO levels are low enough, the generator will run normally.

Ensure that the generator is located in an open outdoor area, with the exhaust pointing away from occupied structures, and pointing away from the prevailing winds, such that those winds do not blow engine exhaust towards the sensor module. If anyone experiences dizziness, headaches, nausea, fatigue, or other symptoms of CO poisoning, get to fresh air immediately and seek the attention of a qualified medical professional. Follow all other directions in this manual regarding the connection and disconnection of electrical devices when starting or shutting down the generator.

When starting the generator, the CO Watchdog LED on the panel may flash. This indicates that the system is running a self-test procedure, and does not indicate a problem.

If the CO Watchdog LED on the panel is **yellow**, a system error has occurred, or the CO sensor has reached the end of its life. Contact WEN customer service (**1-847-429-9263**, M – F 8 – 5 CST, or techsupport@wenproducts.com) for assistance.

When operating your generator, please note the following:

- The CO Watchdog does not discriminate in its input; any source of carbon monoxide in the area around the generator could cause it to activate. If the CO Watchdog LED is blinking red, safety measures should be taken immediately.
- Tampering with, disconnecting, or bypassing the CO sensor could cause hazardous conditions, including but not necessarily limited to injury or death, and will void your warranty. The generator will not run with the CO sensor disconnected or bypassed, or if the CO sensor indicates an error.
- The CO sensor has a lifetime of about 7 years, and is capable of monitoring its lifetime. If your generator shows an error light several years after purchase, it may be time to replace the CO sensor. Contact WEN customer service for assistance.

NOTE: if the generator is oriented so that the engine exhaust is blown towards the CO sensor, the generator may shut down.

SHUTTING OFF YOUR GENERATOR

⚠ CAUTION! Unplugging running devices can cause damage to the generator. Never stop the engine with electrical devices connected and running.

OPTION 1A: AUTOMATIC FUEL SHUTOFF (RECOMMENDED – GASOLINE ONLY)

Your generator is equipped with automatic fuel shutoff. This feature turns off the flow of fuel, allowing for the generator to use up the remaining fuel from the carburetor before turning off. This prolongs the lifespan of the generator by preventing build-up and blockages caused by stagnant fuel inside of a carburetor.

1. Turn off all electrical devices prior to unplugging them from the generator. Unplugging running devices can cause damage to the generator.
2. Allow generator to run at no load for a few minutes to stabilize internal temperatures.
3. Turn the 2-in-1 switch to OFF (Fig. 27).

NOTE: The engine will continue to run until the majority of the fuel in the carburetor is consumed, which takes a few minutes. It will then shut off automatically. This feature helps to prevent the carburetor from being clogged by stale fuel, extending your generator's lifespan.

4. Turn the BATTERY switch OFF (Fig. D).

OPTION 1B: AUTOMATIC FUEL SHUTOFF (RECOMMENDED – LPG ONLY)

Although LPG is not prone to degradation the way gasoline is, it is still a good idea to turn the LPG tank OFF before disconnecting the regulator hose from the generator, so that LPG does not leak from the hose.

1. Turn off all electrical devices prior to unplugging them. Unplugging running devices can cause damage to generator.
2. Allow generator to run at no load for a few minutes to stabilize internal temperatures.
3. Turn the 2-in-1 dial switch to the OFF position (Fig. 27), if it is not in the OFF position already.
4. Turn propane tank valve to OFF position (if the propane regulator hose is connected to the generator). The engine will continue to run until propane in the carburetor is consumed, which will be nearly immediately. It will then shut down automatically.

NOTE: If there is gasoline in the fuel tank, and any gasoline has made it into the carburetor for some reason, the generator may continue to run for a few minutes until the gasoline has been consumed.

5. Turn the BATTERY switch OFF (Fig. D).

SHUTTING OFF YOUR GENERATOR

⚠ CAUTION! Unplugging running devices can cause damage to the generator. Never stop the engine with electrical devices connected and running.

OPTION 2: MANUAL SHUTOFF

In case you are in a hurry and do not want to wait for the generator to automatically shut down, the manual shutoff feature is available. However, this method will leave stagnant fuel in the carburetor, possibly causing blockages, a shortened lifespan, and other maintenance issues. If this approach is frequently taken, make sure to drain your carburetor before any long storage periods.

1. Turn off all electrical devices prior to unplugging them from the generator. Unplugging running devices can cause damage to the generator.
2. Press the engine start / stop button (Fig. 29) once or press the OFF button on the remote control once.
3. Turn the BATTERY switch OFF (Fig. D).

⚠ WARNING! Allow the generator to cool down before touching areas that become hot during use.

CAUTION: Allowing gasoline to sit in the fuel tank for long periods of time can make it difficult to start the generator in the future. Never store the generator for extended periods of time (over 2 months) with fuel in the fuel tank. Refer to “Storing the Generator.”

MAINTENANCE

Proper routine maintenance of the generator will help prolong the life of the machine. Please perform maintenance checks and operations according to the schedule in Table 4.

⚠ CAUTION! Never perform maintenance operations while the generator is running. Before maintaining or servicing the generator, turn OFF the generator, disconnect all devices and allow the generator to cool down.

If there are any questions about the maintenance procedures listed in this manual, please call **1-847-429-9263** M-F 8-5 CST or email **techsupport@wenproducts.com**.

Recommended Maintenance Schedule		Every 8 Hours or Daily	Every 25 Hours	Every 3 Months or 50 Hours	Every 6 Months or 100 Hours	Before Storage	As Necessary
Engine Oil	Check Level	x					
	Replace	x**	x**	x*			x
Air Filter	Check			x*			
	Clean			x*			
Spark Plug	Check/Clean/Regap				x		
	Change				x		x
Fuel	Check Level	x					
	Drain					x	x
Carburetor	Drain	x					x
Spark Arrestor	Check/Clean				x		

* Clean/change more often under dusty conditions or operating under heavy load. Table 5 - Recommended Maintenance Schedule

** Change the oil after the first 8 hours of operation, after the first 25 hours of operation, and every 50 hours after that.

IMPORTANT GENERATOR MAINTENANCE TIPS:

- Drain your carburetor after each use and before storage to prevent it from clogging.
- Do not store the generator with fuel inside the tank for more than 2 months - the fuel will go bad.
- Run the generator for at least 20 minutes every month to charge the battery and maximize lifespan.

CLEANING THE GENERATOR

Keep the generator clean to prevent improper operation or machine damage from dirt and debris. Inspect all ventilation openings on the generator. These openings must be kept clean and unobstructed. If the generator becomes dirty, use a damp cloth to wipe exterior surfaces. Use a soft bristle brush to loosen dirt and oil and use a vacuum to pick up loose dirt. Use low pressure air (not to exceed 25 PSI) to blow away dirt.

⚠ CAUTION! Never clean the generator when it is running! Never clean with a bucket of water or a hose. Water can get inside the working parts of the generator and cause corrosion or a short circuit.

NOTE: Failure to properly maintain the generator will void the warranty.

MAINTENANCE

CLEANING THE GENERATOR

Keep the generator clean to prevent improper operation or machine damage from dirt and debris. Inspect all ventilation openings on the generator. These openings must be kept clean and unobstructed.

If the generator becomes dirty, use a damp cloth to wipe exterior surfaces. Use a soft bristle brush to loosen dirt and oil and use a vacuum to pick up loose dirt. Use low pressure air (not to exceed 25 PSI) to blow away dirt.

⚠ WARNING! Never clean the generator when it is running! Never clean with a bucket of water or a hose. Water can get inside the working parts of the generator and cause corrosion or a short circuit.

CHECKING / ADDING OIL

Check the oil level before each use and every 8 hours of operation (refer to Table 5).

The oil capacity of the generator engine is 18.6 fl. ounces. Add oil when the oil level is low. For proper type and weight of oil refer to “add oil” portion of the “Generator Preparation” section. This is a critical step for proper engine starting. The generator is equipped with a with low-oil shut down to protect it from running without oil.

To check the oil level and add oil:

1. Make sure the generator is on a level surface. Do not tilt the generator, as oil will flow into engine areas and cause damage. Keep generator level!
2. Turn the oil access cover knob to the unlocked position, and remove the access cover from the front panel. Clean around the oil fill. Remove the dipstick and wipe it with a clean rag.
3. Insert the dipstick into the oil fill opening without screwing in. Remove the dipstick to check the oil mark (Fig. 30). Add oil if the oil mark covers less than one half of the dipstick.
4. Using a funnel or appropriate dispenser, slowly add more oil. Repeat the step above until the oil mark reaches the top of the dipstick (you can see oil coming up the threads of the oil fill). Do not over fill.
5. Reinstall dipstick and wipe clean any spilled oil with a rag. Reinstall the oil access cover.

TIP: Your WEN generator is compatible with the WEN 55201 Magnetic Oil Dipstick (not included), available for purchase at wenproducts.com. The dipstick's industrial-strength magnetic tip will collect metal shavings from your generator's oil pan to help preserve the engine and extend your generator's lifespan.

DRAINING THE CARBURETOR

We recommend draining the carburetor after every use and before storing the generator. (If the generator is shut off using the AUTO OFF feature, it is only necessary to drain it before periods of long storage.) Draining the carburetor can prevent the fuel from clogging up the carburetor; a clogged carburetor can prevent the generator from starting.

1. With the help of another person, place the generator on an elevated platform such as a table or desk.

2. Make sure that the 2-in-1 dial switch is turned to "OFF". At this position, the fuel valve is turned OFF so that only the fuel left inside the carburetor will be drained out.

3. Using a Phillips-head screwdriver, unscrew the top two screws and remove the service panel on the opposite side of the recoil starter.

4. The carburetor (Fig. 31 - 1) can be accessed between the engine and the air filter. Locate the transparent tube from the carburetor that extends down through the base plate of the generator.

5. Prepare an approved gasoline-storage container and direct the end of the drain tube into the container.

6. Open up the carburetor drain screw (Fig. 31 - 2) with a Phillips-head screwdriver and drain out any gasoline that has built up inside the carburetor through the drain tube into the approved gasoline-storage container.

7. Once the fuel has drained, tighten the drain screw with the screwdriver.

NOTE: Make sure to drain your carburetor before storing the generator for long periods of time.

8. Reinstall the service panel.

Fig. 31

AIR FILTER MAINTENANCE

Check every 50 hours of operation (refer to Table 5 - Recommended Maintenance Schedule).

Routine maintenance of the air filter helps maintain proper airflow to the carburetor. Occasionally check that the air cleaner is free of excessive dirt.

To inspect and clean the air filter:

1. Using a Phillips-head screwdriver, unscrew the top two screws and remove the service panel on the opposite side of the recoil starter.
2. Take the cover off of the air filter (Fig. 32). Remove the sponge-like air filter element from the casing. Wipe excessive oil and any dirt from inside of the air filter casing.
3. Check and clean the foam air filter element. Good elements can be washed in soapy water. Dry the element in clean cloth (do not twist it). Add a few drops of engine oil to the air filter element and spread it evenly.

If the air filter element has been damaged, replace it with a new one. Replacement air filters can be ordered from wenproducts.com by searching part no. **56380i-1001B.1**.

4. Reinstall the air filter element, air filter cover and service panel.

⚠ WARNING! Running the engine with a dirty, damaged or missing air filter element can result in danger to the operator and cause the engine to wear out prematurely.

SPARK ARRESTOR MAINTENANCE

Inspect and clean the spark arrestor every 100 hours of operation.

The spark arrestor is located outside the muffler, which gets very hot during operation. Allow the engine to cool completely before servicing the spark arrestor. To inspect and clean the spark arrestor:

1. Remove the two Phillips-head screws that secure the spark arrestor to the muffler (Fig. 33).
2. Remove the spark arrestor screen.
3. Carefully clean and remove the carbon deposits from the spark arrestor screen with a wire brush. Replace the spark arrestor if it is damaged (replacement spark arrestors can be purchased from wenproducts.com by searching the **part no. 56380i-1115**).
4. Reinstall the spark arrestor in the muffler and secure it in place with the screws.

SPARK PLUG MAINTENANCE

Refer to Recommended Maintenance Schedule in Table 5 for maintaining the spark plug.

The spark plug is important for proper engine operation. Check the spark plug regularly to maintain proper engine operation. A good spark plug should be intact, free of deposits, and properly gapped.

To inspect or replace the spark plug:

1. Using a Phillips-head screwdriver, unscrew the top two screws and remove the service panel on the opposite side of the recoil starter.

2. Gently pull on the spark plug boot (Fig. 34) to remove it. Be careful not to tear any insulation or wire.

3. Use the included spark plug wrench to unscrew and then carefully remove the spark plug from the engine (Fig. 35).

TIP: There is limited space for the wrench to turn. Use both rows of holes in the spark plug wrench to gain leverage to loosen the plug.

4. Visually inspect the spark plug. If it is cracked or chipped, or if the electrodes are worn or burned, discard it and replace with a new spark plug.

We recommend replacing with a NGK BPR6ES/Torch F6RTC spark plug (part no. **56310i-0104**), available for purchase at **wenproducts.com**.

5. If re-using the spark plug, use a wire brush to clean any dirt from around the spark plug base, then re-gap the spark plug.

6. Measure the plug gap with a spark plug gap gauge. The gap should be 0.7 - 0.8 mm (0.028 - 0.031 in) (Fig. 36). Carefully adjust the gap if necessary.

7. Screw the spark plug back into the spark plug hole using the spark plug wrench. Do not over-tighten spark plug. Recommended tightening of spark plug is $\frac{1}{2}$ to $\frac{3}{4}$ of a turn (15 ft-lb torque/20.33 Nm) after spark plug gasket contacts spark plug hole.

8. Reinstall the spark plug boot, spark plug rubber cover, and service panel.

DRAINING / CHANGING OIL

Change the oil according to the Recommended Maintenance Schedule in Table 5. Change the oil after the first 8 hours of operation, after the first 25 hours of operation, and every 50 hours after that. Change the oil **MORE OFTEN** if operating under heavy load or high ambient temperatures. It is also necessary to drain the oil from the crankcase if it has become contaminated with water or dirt. Changing the oil when the engine is warm allows for more-complete drainage.

To change engine oil:

1. With the help of another person, place the generator on an elevated platform such as table or workbench.

NOTE: To avoid possible gasoline spills from the carburetor bowl, drain the carburetor before draining oil.

2. Turn the oil access cover knob to the unlocked position, and remove the cover from the side panel.

3. Prepare an approved oil-storage container and place it below the oil drainage valve (Fig. 37) to catch oil as it drains.

4. Open the oil drainage valve by turning the lever, and allow oil to drain from the engine completely.

5. Close the oil drainage valve after the oil has drained.

NOTE: Never dispose of used engine oil in the trash or down a drain. Please call a local recycling center or auto garage to arrange proper oil disposal.

6. Unscrew the oil dipstick. Using a funnel or appropriate dispenser, add 18.6 oz. of clean engine oil into the oil fill until you can see oil coming up the threads of the oil fill. Do not over fill.

7. Reinstall the oil dipstick and tighten it securely. Wipe clean any oil spillage and reinstall the oil access cover.

MAINTENANCE

DRAINING THE FUEL TANK

Drain and clean the fuel tank each year, or before storing the generator for longer than two months.

To drain the fuel tank and carburetor:

1. Using a Phillips-head screwdriver, remove the service panel on the opposite side of the recoil starter by unscrewing the top two screws.
2. Locate the carburetor and the transparent drain tube that extends down through the base plate of the generator (Fig. 38).
3. Prepare an approved gasoline-storage container and direct the end of the transparent tube into the container.
4. Remove the fuel cap. Turn the 2-in-1 dial switch to the "RUN" position (Fig. 39). This will open up the fuel valve.
5. Open up the carburetor drain screw (Fig. 38) with a Phillips screwdriver. Fuel will start draining from the carburetor and fuel tank through the drain tube.

NOTE: The draining process may take a few hours, depending on the amount of fuel in your gas tank.

6. Once fuel is completely drained from the tube, reinstall the fuel cap and turn the 2-in-1 switch to "OFF" position. Tighten the drain screw with the screwdriver and reinstall the service panel.

7. Start and run the generator until the fuel runs out.

8. Store the emptied gasoline in a suitable place. DO NOT store flammable materials near the gasoline.

CAUTION: Store the emptied gasoline in a suitable place. Never store fuel for more than 2 months.

BATTERY MAINTENANCE/STORAGE

The lithium-ion battery will receive charge when the engine is running. Remember to run the generator once a month for 20-30 minutes to charge the battery. A charged battery will allow you to start the generator using the electric start button during your next time of need. If the battery is out of charge, you may start the generator using the recoil starter. If the generator is not used for a long period, it is recommended to disconnect the quick-connectors to protect it from losing charge. After disconnecting the quick-connectors, cover the free end with an insulator such as electrical tape.

TIP: You can also connect the battery to an automatic trickle charger to keep the battery charged. If using a trickle-charger, charge the battery at room temperature. Make sure to use a trickle-charger suitable for lithium-ion batteries.

Lithium-ion batteries can be damaged or suffer a shortened lifespan if they are charged in very cold temperatures (below freezing). If you expect to store the generator in temperatures below 25°F (-5°C), we recommend removing the battery from the generator and storing it indoors. If using the generator in temperatures below 25°F (-5°C), we recommend running the generator for at least 15 minutes with the battery removed, or the battery quick-connectors disconnected and covered with an insulator such as electrical tape, and then connecting the battery. This will allow the inside of the generator to warm up, and will greatly reduce the chance of damage to the battery.

⚠ WARNING! It is best to store the battery indoors at room temperature. Do not store your battery outside in the winter, where temperatures may go below 25°F (-5°C), or in any location where temperatures may exceed 104°F (40°C), such as in direct sunlight or inside a vehicle or metal building during the summer.

To reinstall/replace the battery:

1. Using a quarter coin or flat-head screwdriver (not included), open and remove the battery access cover (Fig. 40).
2. Loosen the rubber belt and pull out the battery (Fig. 40).
3. Disconnect the two ends of the quick connector leads from each other, then remove them from the battery terminals (Fig. 41).
4. Replace with an identical new battery (**part no. 56380i-1304**).
5. Install the quick-connector wiring on the battery terminals, then connect the two ends of the quick-connector (Fig. 41) to connect the battery to the generator's system.
8. Return the battery into position and use the rubber belt to fasten the battery.
9. Reinstall and secure the battery access cover.

NOTE: Always recycle used batteries in accordance with local laws and regulations. Contact your local solid waste collection site or recycling facility to obtain information on local recycling processes.

MAINTENANCE

COIN BATTERY MAINTENANCE

- Remove and immediately recycle or dispose of used batteries according to local regulations and keep away from children. Do NOT dispose of batteries in household trash or incinerate.
- Used batteries may cause severe injury or death.
- Call a local poison control center for treatment information.
- Non-rechargeable batteries are not to be recharged.
- Do not force discharge, recharge, disassemble, heat above 140 Fahrenheit, or incinerate. Doing so may result in injury due to venting, leakage, or explosion resulting in chemical burns.
- Ensure the batteries are installed correctly according to polarity (+ and -).
- Do not mix old and new batteries, different brands or types of batteries, such as alkaline, carbon-zinc, or rechargeable batteries.
- Remove and immediately recycle or dispose of batteries from equipment not used for an extended period of time according to local regulations.
- Always completely secure the battery compartment. If the battery compartment does not close securely, stop using the product, remove the batteries, and keep them away from children.

Battery Type	Replaceable Battery	No-Replaceable Battery	No-Replaceable Battery

TRANSPORTATION & STORAGE

TRANSPORTING THE GENERATOR

To prevent fuel spillage when transporting, be sure to perform the following:

1. Tighten the fuel cap.
2. Flip the engine switch to the OFF position.
3. Drain the fuel tank if possible. Refer to section, “Draining the Fuel Tank.”
4. Keep the generator upright. Never place the generator on its side or upside down - doing so could damage the internal components of the generator and make it difficult to start.

⚠ WARNING! Avoid direct sunlight inside a vehicle. If the generator is left in an enclosed vehicle for many hours, the high temperature could cause the fuel to vaporize and result in a possible explosion.

STORING THE GENERATOR

Shut off the generator and allow the unit to cool to room temperature before storing it. NEVER place any type of storage cover on the generator while it is still hot. Do not obstruct any ventilation openings.

Follow the procedures below for properly storing your generator. We highly recommend running your generator once a month for 20 to 30 minutes. Plug in a small load in to ensure there is proper power output.

For Short Periods (30 to 60 Days):

- Drain the carburetor. Refer to page 30, “Draining the Carburetor.”
- Disconnect the quick-connectors from the battery.
- **Add fuel stabilizer:** Follow the suggested portions and instructions of your preferred stabilizer. Run the engine for 15 to 20 minutes, allowing the fuel stabilizer to mix with the gasoline and circulate through the carburetor, and then top off with fuel. Filling the fuel tank full reduces the amount of air in the tank and helps fight deterioration of fuel.

For Extended Periods (Over 60 Days):

- Disconnect the quick-connectors from the battery.
- Drain the fuel tank and carburetor (see “Draining the Fuel Tank”). Never store generator with fuel in the tank for more than two months.
- Change the engine oil (see “CHANGING OIL”).

⚠ WARNING! Store the generator upright in a cool and dry location, away from sources of heat, open flames, sparks or pilot lights.

PRODUCT DISPOSAL

Do not dispose of a used generator or parts with your household waste. This product contains electrical or electronic components that should be recycled. Please take this product to your local recycling facility for responsible disposal to minimize its environmental impact.

Do not dispose of used oil or fuel in the trash or down a drain. Please contact your local recycling center or auto garage to arrange proper oil/fuel disposal.

Please recycle the packaging and electronic components where facilities exist. Please contact your local auto garage or recycling facility to properly dispose of oil/fuel.

TROUBLESHOOTING GUIDE

⚠ WARNING! Stop using the generator immediately if any of the following problems occur or risk serious personal injury. If you have any questions, please contact customer service at **1-847-429-9263** (M-F 8-5 CST), or email **techsupport@wenproducts.com**.

PROBLEM	POSSIBLE CAUSE	SOLUTION
Engine will not start.	1. 2-in-1 dial switch is in wrong position.	1. Set switch to RUN when starting or running engine.
	2. Battery switch is set to OFF (O).	2. Turn battery switch to ON (I).
	3. Engine has not been primed (LPG only).	3. Prime engine.
	4. Battery is too cold.	4. Electric start may be difficult if the battery is too cold. Store the generator or battery in a warmer location.
	5. Oil is low.	5. Add oil.
	6. Engine is out of fuel.	6. Add fuel.
	7. Engine is filled with contaminated or old fuel.	7. Drain fuel in the tank and carburetor. Replace with fresh fuel.
	8. Spark plug is dirty or broken.	8. Clean or replace spark plug.
	9. Propane tank is turned OFF.	9. Dang it, Bobby, I told you to turn that thing on!
	10. Carburetor is air locked.	10. Turn the 2-in-1 switch to OFF. Remove bolt from bottom of the carburetor. Take off the carburetor bowl to allow it to reset. Replace carburetor bowl and reinstall the bolt.
	11. Regulator is stuck.	11. Turn OFF propane tank. Disconnect hose from propane fitting. Contact WEN customer service for assistance.
	12. The battery is dead.	12. Remove the left side panel. Move the choke lever on top of the carburetor manually to start the unit on gas.
	13. Ghost in the generator.	13. Persuade ghost to leave. Consult Bill Murray if needed.
Engine runs, but there is no electrical output.	1. Reset button has activated due to wattage overload.	1. Turn off and unplug all electrical devices. Press reset button. Check the total wattage of the devices and reduce the load if it exceeds the capacity of the generator for your particular fuel (LPG or gasoline).
	2. Breaker has tripped due to wattage overload.	2. Turn off and unplug all electrical devices. Wait 3 minutes, and press the activated breaker to reset. Check the total wattage of the devices and reduce the load if it exceeds the capacity of the generator for your particular fuel (LPG or gasoline).
	3. Bad connecting cord or wire.	3. Check power cords & extension cords. Do not use if any cord is damaged. Replace damaged cords immediately.
	4. Bad electrical device connected to the generator.	4. Try connecting a different device.
Generator runs, but does not support all electrical devices connected.	1. AC or DC receptacles are overloaded; circuit breaker has tripped.	1. Turn off and unplug all electrical devices. Wait 3 minutes, then press the breaker to reset. Check the amperage of the devices to ensure they are within the receptacles' rated capacities.
	2. Short circuit in one of the devices.	2. Disconnect any faulty or short-circuited electrical devices.
	3. Air filter is dirty.	3. Clean or replace the air filter element.
Engine is "hunting" during operation (engine RPM is fluctuating).	1. Gasoline is not running through fuel valve.	1. Make sure there is enough fuel. Make sure 2-in-1 switch is turned to RUN.
	2. Propane level is getting low.	2. Switch to a new propane tank, or use gasoline.
	3. Air filter is dirty.	3. Clean or replace the air filter element.
	4. Spark arrestor is dirty.	4. Clean the spark arrestor.
	5. There is gunk in the carburetor preventing a consistent fuel/air mixture.	5. Use carburetor cleaner spray on the carburetor bowl and jets.

IMPORTANT: Repairs and replacements should only be performed by an authorized technician. Parts and accessories that wear down over the course of normal use are not covered by the three-year warranty.
